| Welcome and Introduction | **Time:** 150 Minutes  
**Note:** Do not read the slides to the students; speak in a conversational tone and use the slides to actively engage them in two-way conversation. Add the occasional brief story or anecdote from your experience to illustrate key concepts. |

**Introduction**

**Say:**

This module describes chain saw components and how they work and explains the correct way to fuel, start, and operate a chain saw. After completing the module, you will practice what you've learned.

Before you try to start a chain saw for the first time, it is important for you to understand how the basic chain saw components work and the engineered safety features of the saw you handle.

### Slide 4: Prework Review

**Review**

Review the topics covered in the prework packet.

**Say:**

We will cover some of these topics again here in the classroom because they are important for safety or because we have more details you need to know. The rest we will review now.

**INSTRUCTOR NOTE:**

Allow students a few moments to answer the questions in the student guide, then discuss the answers. Confirm the right answers and correct any misconceptions.

**Review Questions**

**Q:** What are some guidelines for selecting a chain saw?

**A:** Choose the type of chain saw appropriate for the job and the one that best fits your ability.

**Q:** Why should you always read and keep the owner’s manual?

**A:** To know how to maintain and operate your make and model of saw.

**Q:** What items do you check in the five-point safety check?

**A:** Chain brake, trigger interlock, chain catch, antivibration system, spark arrestor
### Q: What are some guidelines for transporting a chain saw?
### A: Answers may vary, but should include:
- Never transport a chain saw or fuel in the passenger compartment.
- Cover the chain saw bar with a sheath during transport to prevent damaging the saw cutter tooth or other property.
- Always use a sheath (required) that covers the bumper spikes (dogs) and muffler when transporting a chain saw over your shoulder. This greatly decreases the risk of serious physical harm. A sturdy shoulder pad is also recommended.
- Follow the aircraft personnel or pilot’s instructions when transporting a chain saw using aircraft or watercraft.
- Follow the packer’s instructions when transporting a chain saw using pack stock.

### Q: Describe three ways to start a chain saw.
### A: On the ground, firmly supported between your legs, with the bar extended over a log or branch.

---

### Slide 5: Chain Saw Basics

#### Chain Saw Basics

**Say:**
There are two basic types of power saws available on the market today: gas-powered and battery-powered. When selecting the right tool for the job, you should also consider powerhead size, bar length, your skill level, and the specific task at hand. Personal fitness and strength are other considerations, as these factors can dramatically affect your ability to handle, hold, and manipulate a chain saw. Bigger is not always better. Over a short period, handling even a 12-pound chain saw can become physically challenging. Your risk of injury increases significantly as fatigue sets in.
### Slide 6: Chain Saw Components 1

**Say:**

When you first purchase or receive a chain saw you must become familiar with the make and model. Here I have a [make and model]. First, we will discuss the different components of the saw and their functions.

**INSTRUCTOR NOTE**

While holding up the chain saw, point-out the different components identified in each slide. Explain the function of each of the components. If a component requires specific maintenance, now is the time to discuss that maintenance.

- **Bucking/bumper spikes (dogs):** Used to help hold the saw steady against wood.
- **Chain brake:** Stops the chain’s motion.
- **Front handle:** Used to hold and balance the saw.
- **On/off switch:** Turns the saw on and off.
- **Throttle trigger:** Controls the speed of the engine.
- **Throttle interlock:** Prevents the throttle from engaging unless you depress the interlock on the handle.
- **Rear handle:** Used to hold the saw.
- **Fuel tank cap:** Provides access to the fuel tank and seals the tank to prevent spillage.
- **Pull-start grip:** A rubber or plastic handle attached to the starter pull rope.
- **Flywheel cover:** Covers the flywheel and holds the recoil starter.
- **Oil tank cap:** Provides access to the oil tank and seals the tank to prevent spillage.

**Chain Saw Components 2**

**Say:**

- **Air filter cover:** Stops dirt, dust, and sawdust from entering the air filter, thereby protecting the carburetor.
- **Cooling fins:** Provide cooling to the motor cylinder.
- **Muffler:** Reduces exhaust noise.
- **Bar studs:** Hold the bar in place.
- **Chain catch:** Prevents the chain from contacting you in the event of a broken or thrown chain.
- **Tension adjustment screw:** Moves the guide bar to maintain proper tension on the saw chain.
- **Clutch drum cover:** Covers the sprocket and clutch.
  - **Clutch drum (under the cover):** Couples the engine to the chain sprocket when you accelerate the engine above idle speed.

**INSTRUCTOR NOTE:**

Components not shown

- **Chain sprocket:** The toothed wheel that drives the saw chain. Sprockets come in different styles and sizes (e.g., rim sprocket, spur sprocket).
- **Oiler adjustment screw:** Adjusts the amount of oil dispensed to the bar and chain.
- **Choke:** Used for starting a cold saw.
- **Fuel filter:** Prevents dirt and other contaminants from entering the saw’s carburetor.
- **Spark plug:** Ignites fuel in the cylinder.
- **Decompression valve:** Reduces pressure in the cylinder head to enable the chain saw to start more easily.
- **Directional marks (gunning sights):** Used for aiming the undercut and backcut.

Guide Bar Parts

- Motor mount section
  - Chain tensioner pin hole: Where you insert the chain tension pin.
  - Oil hole: Where chain oil from the oiler flows to the chain drivers along the guide bar groove.
  - Mounting slot: Where you insert the guide bar mounting studs to hold the guide bar in place.
- Guide bar body section
  - Guide bar rails: The tie strap of the chain rides on top of these rails.
  - Guide bar groove: Where the chain drivers ride to guide the cutting teeth around the guide bar.
- Sprocket tip section
  - Sprocket tip: Toothed sprocket that guides the chain around the tip of the bar.

Guide Bar Types

Guide bars come in a wide variety of sizes and uses. You must select a properly sized bar for the powerhead and the job.

Let’s first become familiar with the types of guide bars.

- Standard: Bar tip has a roller sprocket for reduced friction and wear.
- Lightweight: In addition to the features of the standard bar, lightweight bars have aluminum inserts that reduce some weight. The weight difference is most noticeable on longer bars. Keep in mind that lightweight bars can be less rigid.
Transition:
Guide bars are marked with information that references the:
- Bar length
- Number of drivers for the chain used
- Pitch of chain used
- Gauge of chain used

DISPLAY NEXT SLIDE

Guide Bar Markings

Say:
Use the correct bar manufactured for the make and model of your saw.

Not all chains will fit every bar. Not all bars will fit every chain saw. You should understand and use the right bar and chain combinations. It is important that the gauge and pitch of the saw chain, guide bar, and sprocket all match.

- **Gauge**—Measures the thickness of the drive link and corresponds to the groove in the bar.
  - The bar gauge and chain gauge must match. The most common gauges are .050 inch, .058 inch, and .063 inch.
- **Pitch**—A measurement between rivets.
  - To determine pitch, measure the distance between three rivets and divide by 2.
  - The most common pitches are .325 inch, \( \frac{3}{8} \) inch, and .404 inch.
  - The pitch of the drive sprocket must match the pitch of the bar nose sprocket.
- **Number of drivers**—The length of the bar dictates the required number of drivers on a chain.

**Slide 11: Saw Chain**

**Saw Chain**

**Say:**

A saw chain has four major components:

- **Rivet:** Holds the parts of the chain together and allows them to rotate.
- **Drive link:** Guides the chain around the bar and transfers rotational energy from the drive sprocket.
- **Tie strap:** Links the cutter tooth to the drive link.
- **Cutter tooth:** Does the cutting. The saw chain has left- and right-hand cutters that enable the chain to cut evenly through the wood.

**Activity: The Saw Chain**

Have the students pass around an actual chain or plastic model and have them identify the different parts.

**IMPORTANT!** Students must wear gloves if you pass around an actual chain.
How a Cutter Tooth Works

Say:

The chain tooth has five parts:

- **Depth gauge**: The depth gauge (commonly referred to as the raker) regulates the thickness of the wood chip the chain saw will remove. If you file the depth gauge too low, the saw chain will jump, jerk, and chatter, causing the chain saw motor to bog down or lose power. If you do not file the depth gauge enough (too high), the chain will not cut enough wood.

- **Cutting corner**: The cutting corner starts the cut into the wood fiber. If the point is rolled over or dulled by hitting dirt, rocks, or metal, you must sharpen it for it to work correctly.

- **Top plate**: The top plate begins separating the wood chip from the kerf and also regulates the kerf width.

- **Side plate**: The side plate does most of the cutting by severing the long fibers in the kerf.

- **Chisel angle**: The chisel angle is on the front of the top plate. This angle separates the wood chip from the kerf. The chisel angle works in unison with the depth gauge.

Cutter Types

Say:

The three most common types of cutter teeth are chipper, chisel, and semi-chisel.

- **Chipper**: The easiest to file. It will tolerate the most dirt and dust.

- **Chisel**: The most aggressive cutter type. There are two types of chisel chain: square ground and round ground. You can use a round file or a specialized file to sharpen a chisel chain. Square ground can be more difficult to file than other types of chain. Chisel chain does not tolerate dirty cutting conditions.
### Semi-chisel:
A less aggressive cutter type than chisel. Use a round file when filing semi-chisel chain. Semi-chisel chain tolerates dirt and dust.

**DISPLAY NEXT SLIDE**

### Cutter Sequence

**Say:**
The three types of cutter sequences are standard or full comp, semi-skip, and skip.

**INSTRUCTOR NOTE:**
Pass around labeled chain pieces and discuss cutter type and cutter sequence. Explain why you would use different chain for different applications. Point out all the differences while passing around the chain or use a pointer on the PowerPoint image.

Discuss the use cases and performance of each cutter sequence.

**Standard/full comp:** Has the most cutting teeth of the three sequences. Its many teeth make it the smoothest and fastest cutting. Usually found on saws with short- to medium-length bars or used for jobs that require extensive brushing or limbing.

**Semi-skip:** A compromise between standard and full-skip sequence. Half its teeth are close together, like standard, and half are like full-skip. Good for most applications.

**Skip:** Best for running on long bars and cutting large, softwood trees. One benefit is that it takes less time to sharpen than the other sequences. Some disadvantages include its lack of cutter teeth, making it grabby in short cuts; its high kickback potential; and its tendency to vibrate. Not a good choice for brushing or limbing.

*Slide 20: Video: Chain Tension* | Video: Chain Tension

**Say:**

We will now watch a video about proper chain tension.

**Video Debrief**

After the video, ask the class:

**Q:** What is the first step in adjusting tension?

**A:** Loosen the bar nuts.

**Q:** What is “snap tight”?

**A:** An extra quarter to half turn on the tensioner so the chain snaps back into place when it pulls out of the bar rails.

**Say:**

Follow along in your student guide as I apply what we learned in the video to this chain saw we just inspected.

**INSTRUCTOR NOTE:**

Follow the steps below as you adjust the chain tension.

**Demonstration: Correct Chain Tension**

1. With the bar nuts lightly installed, raise the tip of the bar.
2. Carefully move the bar and chain forward by turning the chain tensioner to remove slack, making sure the drivers remain in the bar slots and are properly located on the sprocket.
3. You should be able to pull down on the chain (at the middle of the bar) until three drivers just clear the bar rails. The chain should **snap** back in place.
4. Tighten the bar nuts. Do not overtighten them because studs can pull from the case.

**Note:** Once again, point out the tension screw and demonstrate its use, including proper versus improper tension. Discuss the importance of the proper tension and how it can affect the performance of the chain saw.

**Remember:** Refer to your owner’s manual for proper tensioning procedure.

**Transition:**
Maintaining a sharp chain is critically important and will help improve your safety, reduce physical fatigue, and lessen the wear of the bar and powerhead. Pay attention to the amount of sawdust you generate; this is a great indicator of a dull chain (sawdust) or a sharp chain (woodchips).

**Video: How to Properly Maintain and Sharpen Chains**
We will now watch a video of a sawyer sharpening a saw chain.

**Video Debrief**
After the video, ask the class:

- **Q:** What tools are necessary for sharpening a chain?
  - **A:** Round file, flat file, and depth gaugers (rakers)

- **Q:** What would be a good indication that you are filing in the wrong direction?
  - **A:** Easier to put the file through the stroke; easier to line up the marks on the file guide
### Slide 22: Gas-Powered Chain Saws

**Say:**

Gas-powered chain saws have two-stroke motors that require a fuel-oil mixture. Chain saw fuel is most often mixed at a 50-to-1 ratio (50 parts gas to 1 part two-cycle oil). Follow the manufacturer’s recommendations, as they may vary.

### Mixing Fuel

**To mix fuel for a chain saw:**

1. Add the correct amount of two-stroke mix oil to the fuel container.
2. Add the correct amount of gasoline to the fuel container to obtain the correct fuel-to-oil ratio.
3. Cap the fuel container and shake the mixture for 20 to 30 seconds to ensure proper blending.

### Notes:

- You should use the fuel-oil mixture within 30 days of mixing.
- Commercially produced, premixed fuel may also be available and has a longer shelf life. Refer to the manufacturer’s guidance on shelf life.

DISPLAY NEXT SLIDE

### Slide 23: Fueling a Chain Saw

**Say:**

You should always fuel the chain saw on bare ground at least 20 feet from any ignition source. Allow the chain saw to cool before refueling. You should also refill the bar oil when you refill the fuel.

**To fuel a chain saw:**

1. Wipe away accumulated sawdust and dirt from the gas and oil filler caps.
2. After filling, replace the fuel cap and wipe up any spillage.
3. Remove the oil cap and fill with bar oil.
4. Replace the oil cap and wipe up spillage.
5. Move at least 10 feet away from the fill site before you start the chain saw.
Note: While the order you use to refill the fuel and oil tanks on your saw is not critical, make it a habit of performing the task the same way each time to prevent filling the tank with the wrong fluid.

**Display Next Slide**

### What is a Fuel Geyser?

**Say:**

A **fuel geyser** is the forceful expulsion of liquid and vapor fuel from the fuel tank caused by the rapid depressurization of the tank. Heat and agitation cause the pressure increase. A delayed fuel geyser can occur after opening the fuel container.

Fuel geysers can occur anytime fuel, heat, and pressure combine in fuel transport containers or small, gas-powered engines, such as chain saws, leaf blowers, and portable pumps. They have resulted in injury when sprayed fuel and vapor have ignited.

### What do I need to know to protect myself?

Along with the fueling procedures listed above, take the following precautions when fuel, heat, and pressure are present (these steps may prevent significant burns in the event of fuel spray):

- Always assume fuel tanks and fuel containers are pressurized.
- Always check fuel levels before opening the fuel tank or filler cap; more than half a tank may geyser.
- Cover the fuel cap with a rag when opening to contain potential fuel geyser spray.
- Be extra vigilant when equipment is running poorly and the fuel level is above half a tank.
- Do not use fuel older than 1 month.
If the equipment is running poorly or you suspect vapor lock:

- Do not open the fuel cap. Relieving the pressure does not alleviate a vapor lock.
- Check the fuel level through the tank or use the bar oil level to gauge the fuel level.
- If the fuel level is more than half full, do not open the tank!
- Allow the equipment to thoroughly cool. This can take more than 45 minutes.
- Restart the equipment when it is cool.

It is your job to protect yourself and others. Know how to handle your equipment to avoid fuel geysers anytime fuel, heat, and pressure are present.

**Display Next Slide**

**Slide 25: Video: Fuel Geysering: Predictable?**

**Say:**

Now, we will watch a video showing two examples of a fuel geyser in a lab-controlled scenario.

After the video, ask the class if they have questions and provide them with answers.

**Note:**

The content of this video is covered in the student guide under the heading “What is a Fuel Geyser?”

**Display Next Slide**

**Chain Saw Operations**

**Say:**

Because you must release one hand to pull the starter cord, which compromises your grip and some of the control that two-handed operation normally provides, take extra care each time you start a chain saw.

**Important:** Consult your owner’s manual for the correct choke and switch settings for your saw.

**Display Next Slide**
Slide 27: Five-point Safety Check

**Five-Point Safety Check**

**Say:**

Before starting a chain saw, conduct the five-point safety check. Ensuring that all parts are in working order will help prevent injury during use. We will watch a video about the five-point safety check in a minute. First, watch as I do a safety check on this saw.

**DEMONSTRATION: FIVE-POINT SAFETY CHECK**

The five inspection points for the safety check are:

1. Activate the chain brake to ensure that it locks and unlocks the chain properly.
2. Squeeze the trigger to ensure it is locked.
   - Squeeze again while pressing the interlock to ensure it unlocks.
3. Confirm the chain catch pin is present.
4. Check that the antivibration system and fasteners are tight.
5. Check that the spark arrester screen is present.

**DISPLAY NEXT SLIDE**

Slide 28: Holding the Chain Saw

**Holding the Chain Saw**

**Say:**

Your thumb and fingers should always be wrapped completely around the handlebar. This is essential for maintaining control of the chain saw and for effective use of the chain brake.

Your grip on the chain saw should be firm but not overly tight. Chain saw safety features are designed for right-handed use.

Slide 29: Stance | **Stance**  
**Say:**  
You obtain the ideal stance when you maintain your balance with your feet spread apart, knees bent slightly, back straight, and a firm grip on the chain saw. Proper ergonomics are critical for minimizing fatigue and possible injury.  
**DEMONSTRATION**  
Demonstrate the proper stance.

**NOTE:** Consult your owner’s manual for the correct choke settings for the make and model of your chain saw.  
**Video Debrief**  
After the video, ask the class if they have questions and provide them with answers.  
**INSTRUCTOR NOTE:**  
The content of this video is covered in the student guide under the headings “General Guidelines” and “Ways to Support the Chain Saw.”  
**DISPLAY NEXT SLIDE**

Slide 30: Reactive Forces | **Reactive Forces**  
**Say:**  
Always be aware of the potential reactive forces that the chain saw cutting system may cause. Reactive forces will vary at different points around the bar, and in the opposite direction from the direction the chain moves around the bar.  
Next, we will discuss the three reactive forces: pushback, pull-in, and kickback.  
**DISPLAY NEXT SLIDE**
Slide 31: Pushback

Pushback

Say:

Pushback occurs when you use the top of the bar to cut. When you use the top of the bar, energy transfers to you as the chain saw comes in contact with the wood. Although this reactive force is generally not as powerful as the one you experience during kickback, it can knock you off balance.

DEMONSTRATION: PUSHBACK

Show how the saw behaves in a pushback by demonstrating the motion of the pushback reactive force.

DISPLAY NEXT SLIDE

Slide 32: Pull-in

Pull-In

Say:

Pull-in occurs when you cut with the bottom of the bar and energy transfers as the chain pulls the saw forward. The tree or log will stop pull-in as the bucking spikes or as the powerhead contacts the wood.

DEMONSTRATION: PULL-IN

Show how the saw behaves in a pull-in by demonstrating the motion of the pull-in reactive force.

DISPLAY NEXT SLIDE
Kickback

Say:

Kickback can occur during saw operations when the upper portion of the bar nose contacts a solid object or becomes pinched. This can force the bar violently up and back toward you in an uncontrolled arc. Common kickback injuries involve saw cuts to the face, neck, and shoulder. Remain vigilant for this potential danger and plan all cuts to avoid it.

DEMONSTRATION: AVOIDING KICKBACK

Show what a kickback looks like.

Avoiding Kickbacks

Hold the saw with both hands, securely gripping the handle and handlebar between your thumb and forefinger.

- Always be aware of the location of the bar nose and avoid cutting in the kickback danger zone (the upper quadrant of the bar nose).
- Avoid overreaching with the bar and contacting other objects with the upper quadrant of the bar nose.
- Allow the chain to come to a complete stop or engage the chain brake before pulling the saw smoothly from a cut.
- Position your body not to be in the kickback arc.

INSTRUCTOR NOTE:

Please use the “Saw Station Guide” in appendix A for a walkthrough of the “Saw Basics” saw station that will allow students to practice starting and handling the saw, performing a five-point safety check, and gauging reactive forces.

DISPLAY NEXT SLIDE
### Slide 35: Boring

**Boring**

Boring is a technique you can use for a variety of reasons:

- To explore the condition of the wood fiber, validating the occurrence and extent of decay
- To help determine the extent and location of either tension or compression in a log
- To construct an exact hinge width

**Boring steps:**

1. Cut, using the bottom portion of the guide bar tip, until the depth of the cut is equal to the width of the guide bar and deep enough to stop a kickback during steps 2 and 3.

2. Operating at full throttle, align the saw with the direction of cut.

3. With saw at full throttle, press the guide bar straight into the trunk.
Knowledge Check

INSTRUCTOR NOTE
Allow students a few moments to answer the questions in the student guide. Discuss the answers and correct any misconceptions.

Q: Where do you look to determine what type of chain you should order for your chain saw?
A: The markings on the guide bar.

Q: What are some guidelines for fueling a chain saw?
A: Answers should include:
   - Always fuel on bare ground.
   - Maintain at least 20 feet from any ignition source.
   - Allow the chain saw to cool first.
   - Also refill the bar oil.

Q: What is a fuel geyser?
A: The forceful expulsion of liquid and vapor fuel from the fuel tank caused by the rapid depressurization of the tank. Heat and agitation cause the pressure increase.

Q: How can you protect yourself from a fuel geyser?
A: Answers should include:
   - Always assume fuel tanks and fuel containers are pressurized.
   - Ensure the cap is correctly secured.
   - Always check fuel levels before opening the fuel tank or filler cap. Fuel levels of more than half a tank may geyser.
   - Cover the fuel cap with a rag when opening to contain potential fuel geyser spray.
   - Be extra vigilant when equipment is running poorly and the fuel level is more than half a tank.
   - Do not use fuel older than 1 month.

Q: What are the forms of reactive force?
